

Provides a bright metallic shine at a fraction of the cost of precious metal. Unfortunately, metal is relatively heavy and expensive, which is where the benefits of this silver paint come in. This paint consists of microscopic metal particles suspended in resin, and it can give many different surfaces the strong, clean look of real steel. That alone is a substantial cost savings, and users can also achieve a significant weight reduction depending on the composition of the base material. There are two types of paint available to meet requirements for either water- or solvent-based resin. With both types, two coats of the paint and two coats of a clear topcoat are recommended for best results. Currently, it is used mostly on industrial products, but it could be used on any surface that can be painted. Consider using it on tabletops, exterior doors, light fixtures, switch plates, shower door frames, and to furniture, and ornaments.
